

1 Ponemos el código en Python que necesitamos.

```
home > a > asd.py > ...
1 import socket
2
3 s = socket.socket(socket.AF_INET, socket.SOCK_RAW, socket.IPPROTO_TCP)
4 s.setsockopt(socket.IPPROTO_IP, socket.IP_HDRINCL, 1)
5
6 ip_header = b'\x45\x00\x00\x1c' # Version, IHL, Type of Service | Total Length
7 ip_header += b'\xab\xcd\x00\x00' # Identification | Flags, Fragment Offset
8 ip_header += b'\x40\x01\x6b\xd8' # TTL, Protocol | Header Checksum
9 ip_header += b'\x0a\x00\x02\x0f' # Source Address (10.0.2.15 0A.00.02.0F)
10 ip_header += b'\x5b\x8e\xd6\xb5' # Destination Address (91.142.214.181 5B.8E.D6.B5)
11
12 icmp_header = b'\x08\x00\xe5xca' # Type of message, Code | Checksum
13 icmp_header += b'\x12\x34\x00\x01' # Identifier | Sequence Number
14
15 packet = ip_header + icmp_header
16 s.sendto(packet, ('91.142.214.181', 0))
```

Con nuestras IPs de origen y destino.

2 Ponemos a capturar el wireshark y enviamos el paquete con el comando de a continuación

```
sudo: /home/a/asd.py: orden no encontrada
a@a:~$ sudo /bin/python3 /home/a/asd.py
```

3. Filtramos por ICMP y vemos las request y los reply

icmp						
No.	Time	Source	Destination	Protocol	Length	Info
3	0.392780191	10.0.2.15	91.142.214.181	ICMP	42	Echo (ping) request id=0x1234, seq=1/256, ttl=64 (req)
4	0.413809710	91.142.214.181	10.0.2.15	ICMP	60	Echo (ping) reply id=0x1234, seq=1/256, ttl=57 (rep)
